

WINDOW FILMS

Up to $\frac{1}{3}$ of heating and cooling costs are lost to inefficient windows. If you have windows that are in good shape but aren't efficient, window film is a good solution.

1 PICK THE FILM AND CLEAN THE WINDOW

Mix a solution of soap and water in a spray bottle and use it to clean the window.

2 CUT AND APPLY THE FILM

Cut the pieces of film so they measure about $\frac{1}{2}$ " larger than the window.

3 FLATTEN AND TRIM

Use a small squeegee to push air bubbles to the edges, then trim.
